19. On the quantity of lime required for the treatment of industrial waters. — Ipari Stork zártkörűekszélektivitási mérnökségeként — B. Lengyel, A. Schneer and B. Csillag. [Journal of the Hungarian Chemical Society — Magyar Kémikusok Lapja — Vol. VII, No. 4, April 1952, pp. 117—121, 1 fig., 2 tabs.]

The quantity of lime required for decarbonizing industrial (mainly boiler feed) waters is less than the quantity arrived at through computations with stoichiometric equations. Experiments proved that the difference was caused by the magnesium content of the natural waters. The quantity of lime required for decarbonization is determined by the following formula based on the results of investigations: lime =  $10(K + Mg/100 + 0.02Mg^2 + c)$ , where  $K$  = the quantity of carbonates;  $Mg$  = magnesium hardness,  $c$  = free carbonic acid, all in "German hardness degrees" (one degree = 10 mg  $CaO$  in one-l of water). Experiments conducted with natural and artificially prepared waters have proven that the proposed formula gives more accurate and generally valid results than any used so far. — B. Lengyel.

Title : Titrimetric Determination of Zirconium.

Orig Pub : Magyar kem. foluoirat, 1957, 63, No 10, 295-296

Abstract : Description of 2 new methods of determining Zr in minerals which are superior, in sensitivity and selectivity, to the known methods. According to the 1-st method Zr is precipitated from hydrochloric acid solution with mandelic acid (I) or with p-bromomandelic acid (II), the precipitate is dissolved in a saturated solution of  $\text{Na}_2\text{CO}_3$ , I (or II) is oxidized with K-permanganate, to benzoic (or p-bromobenzoic) acid and the excess  $\text{KMnO}_4$  is determined in the usual manner with  $\text{H}_2\text{C}_2\text{O}_4$ . 2-50 mg Zr are determined with an error of  $\pm 1\%$ . The 2-nd method is suitable for determination of less than 2 mg Zr and differs from the 1-st in

Photometric Determination of Zirconium  
ORIG. PUB. : Magyar Kem Folyoirat, 64, No 10, 371-376 (1958)  
ABSTRACT : The system Zr-morin (I) has been investigated photometrically using light filters of 420 and 470 m $\mu$ . It has been established that the absorption of the yellow chelate compound of Zr with I is independent of the Zr : I ratio when more than two mols I are present per gm-atom Zr and is independent of the concentration of the acid (HCl) when the latter exceeds 1.5 N. The absorption increases by up to 1.5 % on standing for 2 hrs. The complex is not very soluble

Uranium products were produced which do not dis-  
solve easily in water but have good solubility in organic  
solvents, these compounds can be sublimated in vacuum.  
U(IV) compounds were found to be the most suitable for  
sublimation. U(IV) complexes were obtained in pure form  
and the absorption curve was plotted for its acetylacetoneate  
and thenoyltrifluoroacetonate complex compound remaining  
unchanged even in solution in the presence of air.

Inst Title : Titrimetric Determination of Zirconium. I. Titration of Zirconium with Potassium Permanganate in an Alkaline Medium

Orig Pub : Magyar kem. folycirat, 1959, 65, No 1, 35-36

Abstract : The possibility of an indirect determination of Zr by an oxidation-reduction titration of mandelic acid (I) with  $\text{KMnO}_4$  solution was studied. As a preliminary step the method of titrating I and p-bromomandelic acid (II) with  $\text{KMnO}_4$  solution in an alkaline medium (1-2 N. NaOH) was worked out;  $\text{Nb}_2\text{O}_5$ ,  $\text{Ta}_2\text{O}_5$ ,  $\text{SiO}_2$ , and  $\text{WO}_3$  do not interfere. I and II are quantitatively oxidized in the titration to benzoic and p-bromobenzoic acid, respectively. (I and II are

quantitatively separated from the reaction mixture); nevertheless, ~ 11% more than the theoretical amount of  $\text{KMnO}_4$  is used up, apparently because of auto-decomposition. The precipitation of Zr with I takes place quantitatively, and the precipitate formed has a stoichiometric composition; I/sic/ cannot be sued for the quantitative precipitation of Zr. In the determination of Zr the solution to be analyzed containing 2-20mg Zr is evaporated to 20-100 ml, 15-80 ml conc. HCl is added, the solution is heated to 95°, 15-80 ml 16% solution of I is added dropwise while stirring, and the mixture is kept on a water bath for several hours. After 1-2 days the precipitate is filtered off using a glass filter, washed first with mother liquor (the filtrate obtained after the precipitation of Zr mandelate precipitated from pure Zr solutions), then with ethanol and ether, dried at 110-120° and dissolved

TITLE: Chromatometric determination of anthranilic acid by total wet oxidation  
according to an equivalent weight ratio of 1 : 28

SOURCE: Acta chimica academieae scientiarum Hungaricae, v. 44, no. 3, 1965, 267-276

TOPIC TAGS: organometallic compound, chromate

ABSTRACT: As seen by the experimental results, anthranilic acid undergoes oxidation with sodium dichromate, in a medium of concentrated sulfuric acid at 115° within 40 minutes, in a stoichiometric reaction with the formation of water, carbon dioxide and ammonia. The mixture used for the moist combustion can also be used as a standard solution. When the solution is diluted at the end of the reaction, the excess chromium(VI) in it can be titrated with iron(II) in the presence of ferron as indicator. When an 0.5 per cent correction is applied for the spontaneous decomposition of chromium(VI) solution not consumed in the oxidation, the titration values for anthranilic acid and for metal anthranilates agree within  $\pm$  0.2 per cent. One ml of 0.1 N sodium dichromate corresponds to 0.4898 mg of anthranilic acid or M/650<sup>\*</sup>mg of divalent metals.  
\*M = molecular wt. The authors thank Professor, Doctor B. Lengyel for his participation in the experimental work. Orig. art. has: 1 figure and 6 tables. [Based on authors'

The relation of glycaemia to the number of lymphocytes and eosinophils in the healthy and in patients with chronic lymphatic leukaemia. PATOL. POL. 1956, 7/3 (247-256) Graphs 6 Tables 7

The basic group of subjects examined consisted of 10 cases of chronic lymphatic leukaemia, while the control group was composed of 20 healthy subjects. The sex and age differed. In all the cases examined, the fasting sugar level in the blood, the leucocytosis, and the absolute number of lymphocytes and eosinophils circulating in the blood were determined. Subsequently, 50 g. of glucose were administered orally, and these indices were estimated every half hour for 3 or 4 hr. The same tests were carried out on the same individuals after 2 days, having first administered 10 U. of crystalline insulin s.c., and again 2 days later after an i.m. injection of 0.3 mg. of adrenaline. The behaviour of the curves of the glycaemia and eosinophils was the same, whether glucose, insulin or adrenaline had been administered, in patients with leukaemia and in healthy subjects. The course of the lymphocyte curves undergoes certain changes, which show a drop in the number of lymphocytes after glucose and adrenaline greater than in healthy subjects, and a more rapid and greater rise after insulin. It was established that the sugar level alone does not determine the level of the lymphocytes and eosinophils, and the existing interdependences are conditioned by certain hormonal substances which affect the glycaemia, and at the same time regulate the composition of the peripheral blood cells. Adrenaline, insulin, and the hormones of the adrenal cortex appear to play the principal part. Interpreting these deviations, the author assumes the sensitization of the lymphocytes in cases of lymphatic leukaemia to the accumulative action of insulin and the cytolytic effect of the 11-oxysteroids of the adrenal cortex. "Some Problems of Therapy of Malignant Diseases of the Lympho-Reticular System."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 22, 27 May 63,  
pp 789-792.

Abstract: [Authors' English summary modified] Authors discuss the relationship between leukemia and lymphatic sarcoma and the difficulties of differentiation between a neoplasm and leukemia in the lympho-reticular system. They exemplify the problem by citing three cases, and recommend careful observation during x ray treatment in view of the fact that the existing classification of the malignant diseases of the lympho-reticular system does not include the prognosis. There are 25 references, of which eight (8) are Polish, two (2) German, and the remaining 15 - Western.

SZITA, Jozsef, Dr, ROHNY, Bela, Dr, SCHNEIDER, Agnes, Dr; National Public Health Institute and Central State Hospital (Orszagos Kozegeszsegugyi Intezet es Kozponti Allami Korhaz).

"Experiences With Central Sterilization Used in the Central State Hospital for Two Years."

Budapest, Magyar Sebeszet, Vol XVI, No 4, Aug 1963, pages 209-216.

Abstract: [Authors' Hungarian summary] The effectiveness of the central sterilization unit, established in 1960 in the Central State Hospital, is evaluated after 2 years of existence. The problems of location, equipment, personnel and instrument supply, the method of collection and distribution of the material and the work procedures performed by the unit are described. The problems remaining to be solved are pointed out. It is concluded that a central sterilization unit is effective for the decrease of hospital infections and thus contributes to the raising of the standards of care. Although the initial establishment is expensive, the elimination of surgical infections, the increased insurance of sterility and the saving in working hours will return the initial expenditures in a short time. 13 Hungarian, 13 Western references.

The determination of the potential constants of polyamine molecules. Josef Pliva and Bohumil Schneider (Ustav organické chemie, ČSAV, Praha 1). Chem. Listy 49, 168-63 (1955).  
[of preceding abstr.] It is shown that the quadratic potential const. matrix  $K$  of a polyat. mol. may be generally expressed in the form:  $K = G^{-1}A + \lambda K$ , where  $\lambda K$  is the matrix of correction members. Some forms of the correction matrices are discussed and for the case of two-row potential const. matrix a method is shown which gives approx. expressions for the correction members. The values of potential const. calcd. by this method agree well with the published values for hydrid. mols.  $XH_3$ , simple hydrocarbons, and generally for mols., where the non-diagonal kinematic const.  $G_{ij}$  ( $i \neq j$ ) are relatively small.

ABSTRACT : constants obtained are compared with the values given in the literature for trichlorohalogeno derivatives of silane and with the constants for the analogous carbon-containing compounds. A splitting of the highest frequencies in spherically symmetric tetrahalogeno derivatives is observed. However, in the case of SiCl<sub>4</sub> this splitting cannot be ascribed to Fermi resonance and some other explanation must therefore be found. For Communication I see RZhKhim, No 1, 1955, 101.

TITLE: On the structure and properties of polyamides. II. Determination of crystallinity in polycaprolactam blocks by infrared spectra

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 34, abstract 3D232  
("Collect. Czechosl. Chem. Comms", 1962, v. 27, no. 8, 1760 -  
1769, English; summary in Russian)

TEXT: A method is elaborated for a quantitative analysis of polycaprolactam blocks by its infrared absorption spectra. For the spectral measurements of polycaprolactam use was made of turnings taken off from the blocks. By means of the elaborated method the content of conformations A and B was determined for a series of samples of alkaline polymerized blocks of polycaprolactam. For all investigated samples the content of the form A (crystalline  $\alpha$ -form) was found equal to 57 - 58%. The correlation between infrared spectra, crystallinity, density and means of obtaining polycaprolactam is discussed. It is concluded that the density cannot serve as a fundamental criterion for eva-

The increasingly frequent use of plastics in industry and the consequent necessity of familiarising users with the methods of generating heat energy for such purposes have prompted the author to review chemical substances used as components in plastic materials, and the equipment used for thermal reactions. He deals with frequency systems, infra-red heat rays, steam heated hydraulic presses, heating during the rolling process and welding burners.

TITLE:

Chemistry of trimethylene oxide derivatives I. Cis-  
and trans-7-oxabicyclo(4,2,0.) octane (A).

PERIODICAL: Magyar Kémiai Folyóirat, no. 1, 1963, 37-41

TEXT: Preparation of the cis- and trans-modifications of A was attempted, under stereochemically controlled conditions. Cis 2-oxy-methyl cyclohexanol was prepared by the method of Mannich and Brose; the diacetate of the trans compound was prepared by the method of Matti, which was then transformed to the corresponding diol. Crystalline cis- and trans-2-p-toluenesulphonyloxy-methyl cyclohexanols were then prepared. To close the rings the cis- and trans-monotoluene-sulphonic esters were dissolved in ether and the solution was added dropwise to concentrated aq. KOH. After distillation a product with the composition of  $C_7H_{12}O$  was obtained, which did not contain

Card 1/2

Chemistry of trimethylene ...

tain active hydrogen. The ir spectrum of this compound showed a strong absorption band at  $950\text{ cm}^{-1}$ , characteristic of cyclic ethers. The second fraction (12.7%) was found to be largely 2-methylene-cyclohexanol, and the third fraction (21.8%) a dimer with the composition of  $C_{14}H_{24}O_2$  whose structure is now studied. To establish structure of the cis- and trans-7-oxa-bicyclo(4,2,0)octane, both compounds were dissolved in absolute ether and treated, at room temperature, with p-toluenesulphonic acid. The resulting oily products were reacted with trimethylamine. Both products of this reaction were tested by paper chromatography. The establishment of configuration is discussed. There is 1 table.
